To service technician

The service manual contains detailed service information for Model TSR-900 and TSR-905 with the exception of radio band function.

The basic difference between Model TSR-900 and TSR-905 is radio band.

For example:

Model TSR-900 has the functions of FM, SW, MW and LW.

Model TSR-905 has the functions of FM, SW1, SW2, and MW.

Illustration of the model appears on front cover.

Please give attention to next caution.

The followings are the safety servicing guidelines for all audio amplifiers and radio receivers.

Service work should be performed only after you are familiar with all of the following safety guide.

To do otherwise increases the risk of potential hazards and injury to the user.

Safety guide

1. Be sure that all components are positioned in such a way to avoid possibility of adjacent components shorts. This is especially important on those chassis which are transported to and from the repair shop.
2. Always replace all protective devices such as insulators and barriers after working on a receiver.
3. Check for frayed insulation on wires including the AC-cord. Also check across-the-line components for damage and replace if necessary.
4. All fuses and certain resistors and capacitors which are of the flameproof type must be replaced with exact same types to prevent potential fire hazard.
5. After re-assembly of the set always perform an AC-leakage test on the exposed metallic parts of the cabinet such as the knobs, antenna terminal, etc. to be sure the set is safe to operate without danger of electrical shock.

To order repair parts

Part orders must contain:

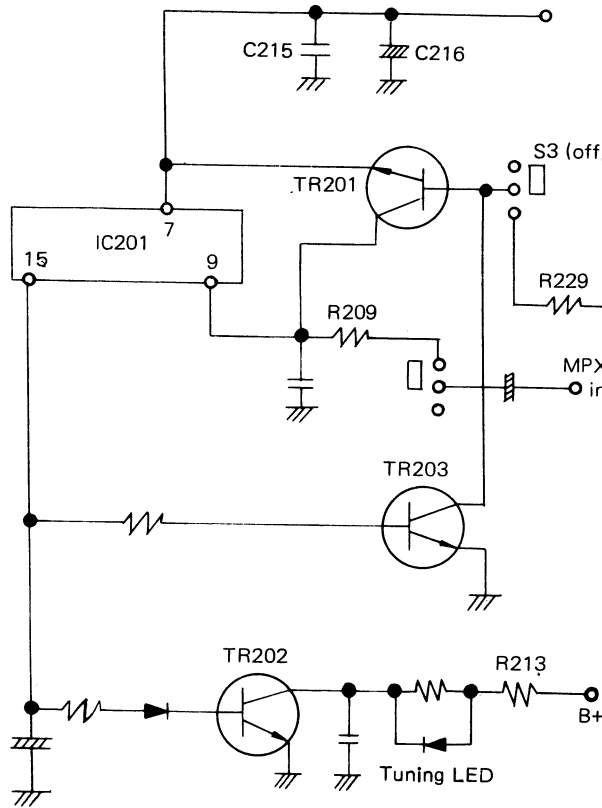

1. Model Number found on front cover in this service manual.
2. Part Number, Description and Quantity.

CIRCUIT DESCRIPTION

(1) Muting Circuit (TR201 and TR203)

1. When selecting FM broadcasting, white noise appear between station and station.
2. When white noise appear, turn on muting switch (S3), bias is added to TR201 base through R229 and TR201 is turned on.
3. Noise that appear to IC201 Pin 9 is grounded through TR201 (Collector-Emitter) and C215.
4. Receiving a signal for broadcasting, the voltage of IC201 pin 15 will appear in proportion to input signal strength. And then TR203 is turned on, TR201 base is grounded, TR201 is turned off.
5. FM detection output has become MPX input signal through R209.

(2) Tuning LED (TR202)

1. Tuning LED is lighted in the best tuning.
2. When the signal for broadcasting is received, the voltage of IC201 pin 15 appear in proportion to input signal strength, TR202 is turned on.
3. A current that flow through R213 and TR202 (Collector-Emitter) light tuning LED.

DIAL CORD ARRANGEMENT

Fig. 1.

Set the varicon to minimum frequency and string the cord by following the number sequence order as shown in Fig. 1.

ALIGNMENT INSTRUCTIONS

This cassette radio has been aligned at the factory and normally will not require further adjustment. As a result, it is not recommended that any attempt is made to modify any circuit. If any parts are replaced or if anyone tampers with the adjustment, realignment may be necessary.

Test equipment required

1. AM/FM signal generator
2. IF sweep generator (10.7 MHz) for FM
3. IF sweep generator (455 kHz or 465 kHz) for AM (SW₂, SW₁, MW and LW)
4. Standard dummy antenna for FM & SW₂
5. Standard loop antenna for AM (SW₁, MW and LW)
6. VTVM
7. Oscilloscope
8. Frequency counter

Note 1.: Adjust T202 (T4) and T203 (T3) to get maximum gain and symmetry in IF response as shown in Fig. 4.

Fig. 4

IF response for weak input signal.

Fig. 5

IF response for strong input signal.

After adjust IF response for weak input signal, supply strong input signal and also adjust T202 (T4) and T203 (T3) to make part (a) flat as shown in Fig. 5.

Note 2. : Adjust output of sweep generator so that noise appears on IF-curve as shown in Fig. 6 below and adjust T201 (T1), for maximum indication.

Note 3. : Adjust T204 (T2) to be IF-curve into S-curve (See Fig. 7) and adjust T204 (T2) so that declined part of S-curve has to be just linear.

If ceramic filter is used in RF part, adjust T204 (T2) so that part (A) and part (B) are symmetrical on either side of vertical line, because the marker of 10.7MHz on sweep generator is not on the center of S-curve.

Tape head and capstan cleaning

1. Periodically clean the tape head, capstan drive shaft and other tape handling surfaces to insure proper tape handling and optimum frequency response.
2. Use a cotton swab dipped in head cleaner or denatured alcohol to clean all tape handling surfaces.
Wipe dry.

Tape head demagnetization

When servicing tape unit, do not use magnetized screwdrivers or wrenches near the tape head since they can magnetize the head.

A magnetized head will result in loss of high frequency response and increased noise.

Head adjustment

Head adjustment is normally required when the head is replaced or for cases of cross-talk and poor high frequency response.
